Site Rotation vs. Buttonhole

Major differences between Site Rotation and the Buttonhole Technique
Site Rotation (Rope Ladder Technique)

- Site rotation with every cannulation
- Cannulators independently determine the angle of entry
- Avoid scabs
- Three-point technique
- For fistulae or grafts

Buttonhole Technique

- Reuse same sites each treatment
- Uses blunt needles
- Scab removal required
- Must follow the track of the original cannulator
- Side-to-side technique
- For AV fistulae only

Troubleshooting

Skin/Tissue Tunnel Track + Vessel Flap = Buttonhole Site

- Skin/tissue buttonhole tunnel track forms like the scar tissue track from a pierced ear.
- Vessel flap is created by repeated punctures with the sharp needle at the same site. Vessel flap will then be displaced by the blunt buttonhole needle at each cannulation after the tunnel and flap are created.
Getting Down The Tunnel

- Fluid overload may cause tissues to swell, narrowing the tunnel
  - a) gently rotate the needle slightly, side to side
  - b) flush the needle tubing with saline, allowing it to drip off the end of the needle

Finding the Flap

1) After the weekend
- Blood vessels swell if fluid intake is excessive, and shifts the flap so it is no longer at the base of the tunnel.
- Insert the blunt needle to the end of the tunnel, then gently lift the tip upward to find the flap.

Well-developed AVF walls

“Trampoline Effect”

Difficulty getting the blunt needles into the fistula – Why?
1. Thick-walled fistulas
2. Original blunt needles were not pointed enough

[Dr. Twardowski, personal correspondence 2006; Milburn et al, n.d.]
Best Demonstrated Practice

- Allows the needle to direct the needle down the buttonhole, and not the cannulator
- Hold the tubing with thumb and forefinger just behind the wings

Touch Cannulation Technique

When to Change to Blunt Needles

- This will be individual to each patient, but look for these things:
  > Does the exit site look well-healed?
  > Can you visualize a round hole?
  > Is there a decrease in resistance from day-to-day?
- Do not use excessive force when changing to blunt needles.

Focus On Infections

- Improper skin cleansing
- Improper scab removal
- Contaminated needle
- Improper cannulation of the track

Used with permission of Dr. Tony Samaha
Best Demonstrated Practice
2-Step Skin Cleaning Protocol

- The patient should wash their arm prior to the cannulation procedure
- The arm should be cleansed prior to scab removal with facility antimicrobial
- Remove the scabs
- Prep the skin with facility antimicrobial

Example

Network 16’s Sample
Two-Step Cleaning Protocol
for Buttonhole Sites
Prior to Cannulation to Prevent Infections

Do’s and Don’ts of Scab Removal

- Don’t flip the scab off with the needle you will use for cannulation.
- Don’t use a sterile needle – you could cut the patient’s skin.
- Don’t let patients pick off their scabs.
- Don’t stick through scabs

- Do use either:
  ~a sterile tweezer;
  ~soak two 2 x 2s with NS or alcohol-based gel;
  ~place a warm, moist washcloth over sites;
  ~stretch skin around scab in opposite directions; or
  ~have patient tape alcohol squares over sites prior to dialysis.
Policy & Procedure

Important inclusions:
~ single cannulator – track creation
~ same site, angle, depth of needle insertion
~ site cleaning – 2-step protocol
~ scab removal
~ switching from sharp to blunt needles

Excessive Bleeding

- Track being cut
- Track being stretched
- Sharp needles used long-term
- Flipping needles
- Damage to vessel wall flap
- Possible stenosis

Stenosis Formation

- Causes back pressure into the AVF
- Increases venous pressures
- Increases post treatment bleeding

Courtesy of the Cleveland Clinic
Response to Stenosis

- for new aneurysms, and increased venous pressures
- for changes in the bruit
- for changes in the thrill, and enlargement of aneurysms

Troubleshooting

Why a Single Cannulator?
- prevents cone-shaped tracks that lead to oozing
- prevents the formation of a larger opening
- bigger scabs that are harder to remove

Troubleshooting

Unsuccessful cannulation
- not following the originator's angle of entry
- unstable buttonhole due to: excess upper arm tissue or excess skin
Best Demonstrated Practice

Cushion Cannulation Technique

- Wheelchair cushion placed under the access arm as far up in the axilla area as possible
- Allows for better visualization – raises the arm up for the cannulator
- Stabilizes the arm and tissue
- Easier to maintain same entry of angle when using the buttonhole technique

Mott & Prowant (2006). Nephrology Nursing Journal 23(3)

Summary - Need to Know Before Cannulating a Buttonhole...

- Developed buttonholes use blunt needles
- Direction of the buttonholes
- Angle of insertion
- How to remove scabs
- Never flip needles in buttonhole sites
